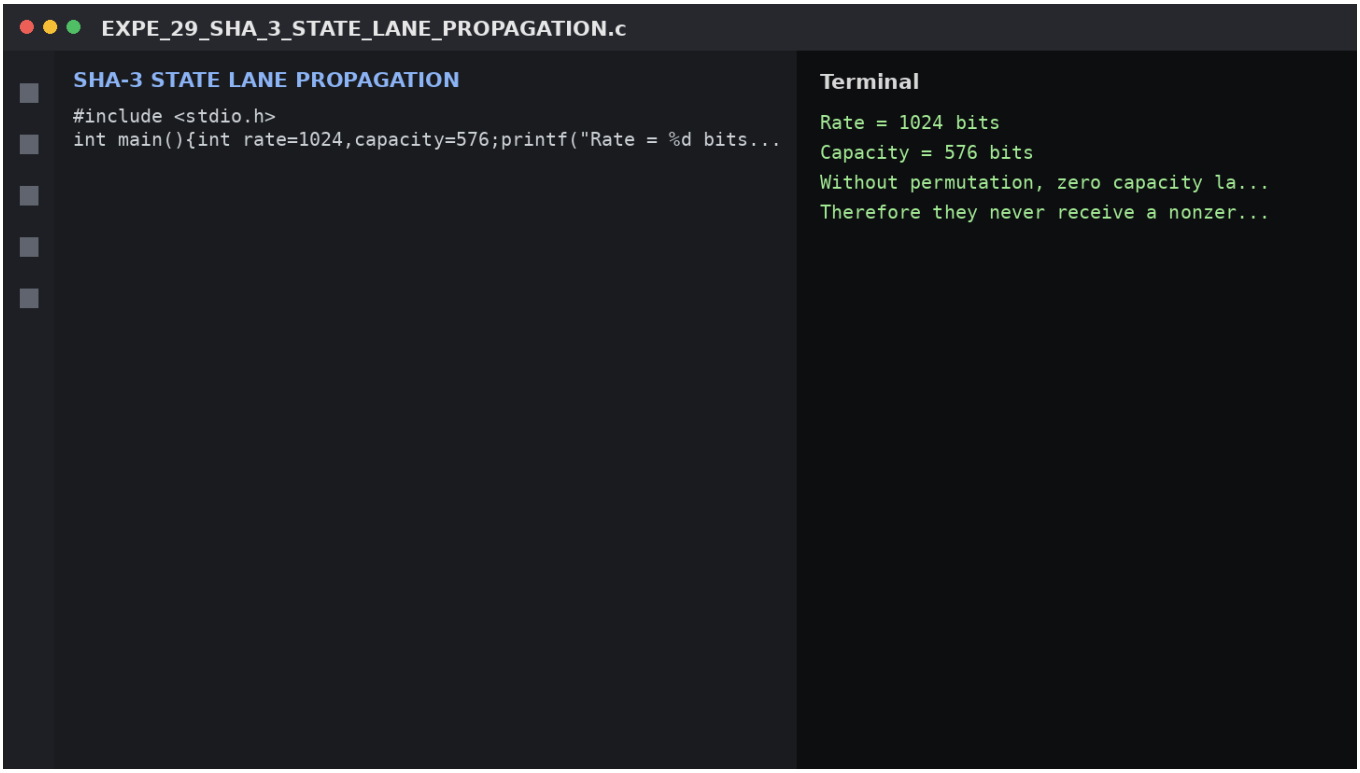
EXPERIMENT 29 – SHA-3 STATE LANE PROPAGATION

C Program

```
#include <stdio.h>
int main(){int rate=1024,capacity=576;printf("Rate = %d bits\nCapacity = %d bits\n",rate,capacity);printf("Without permutation, zero capacity
```

Execution Screenshot



Output

```
Rate = 1024 bits
Capacity = 576 bits
Without permutation, zero capacity lanes remain zero.
Therefore they never receive a nonzero bit.
```
